ENRO Collect VC - the compact vacuum robot for flat lying areas in cattle barns!

The impressive navigation and PC route planning of the ENRO manure robot will also be used in the new ENRO Collect VC vacuum robot which is launched at the beginning of 2025. The ENRO Collect VC impresses with its compact design with a height of just 52 cm and a working width of 1.5 metres. This allows it to slip skilfully under any barrier.

The large working width reduces the number of journeys required for wide walkways and thus increases capacity. Integrated spray nozzles ensure that the walkway surface is moistened and an effective cleaning result is achieved.

When emptying, spray nozzles clean the slurry tank and thus improve operational safety. Construction costs can be significantly reduced due to simpler concrete work.
